

OptiRent

Villa Listing Audit — Developer Build Pack

A Réntlyn product · MVP · Owner self-audit · Canggu-first · v3.0 · June 2026

Single ICP: villa owners. One-time paid report. Includes scoring prompt.

In one line

A self-serve web app: a villa owner pastes their Airbnb URL and gets a free score, an underpricing figure vs. comparable villas, and a problem count. They pay once (\$49) to unlock the full fix list, rewrites, and a PDF. Data from AirROI; scoring from Claude.

Hero: “Your villa is leaving money on the table. We help you take it back.”

1. ICP & monetization

Single ICP: individual villa owners (self-managing). No managers, agencies, or portfolios in v1.

Tier	Owner gets
Free	Score + underpricing figure + problem count ('8 issues, 3 critical'). No fixes.
Paid (one-time \$49)	Full fix list + paste-ready rewrites + PDF.

Hedges (don't block): discounted 60-day re-audit upsell; capture email from all users. Keep payment one-time; don't hard-code against a future subscription.

2. Scope

In (v1)

- Public page: paste URL → free result (email-gated).
- AirROI: listing content + performance + comparables.
- Claude: score, fixes, rewrites (strict JSON).
- One-time Stripe payment (USD) unlocks paid content + PDF.

3. Stack

Layer	Tool	Notes
Frontend	Next.js	Audit page + result + paywall + PDF
Backend	Next.js API routes	Orchestrates AirROI + Claude
STR data	AirROI API	Listings, comparables, metrics
AI	Claude API	Scoring engine (section 6)
DB	Postgres (Supabase)	audits, leads, payments, snapshots
Payments	Stripe	USD one-time
PDF	HTML → PDF	Branded report

Verify first: does AirROI /listings return full description + ordered photos, fresh enough to score? If not, add a light Apify content scrape; keep AirROI for performance/comps.

4. Core flow

1. Owner pastes Airbnb URL; capture email (gates free result).
2. Resolve URL → AirROI listing; pull content + performance.
3. AirROI comparables → comp set + benchmark rate.
4. underpricing = benchmark – listing rate (store comp count + basis).
5. Claude → strict JSON (score, fixes, rewrites, problem_count).
6. Show FREE: score + underpricing + problem count. Hide fixes behind paywall.
7. On payment → reveal fixes + rewrites + PDF; email report link.

5. Data model

Table	Key fields
audits	id, airbnb_url, airroi_listing_id, email, created_at, overall_score, category_scores(json), underpricing_idr, comp_count, comp_basis, problem_count, critical_count, fixes(json),

	rewrites(json), paid(bool)
leads	id, email, airbnb_url, score, underpricing, problem_count, created_at, source
payments	id, audit_id, amount_usd, provider, provider_ref, status, created_at

6. Scoring engine — Claude system prompt

Core IP. Drop this verbatim into the Claude endpoint's system prompt. It takes AirROI listing JSON + comp summary and returns strict JSON only. Parse defensively; retry once on malformed JSON.

Method

Score 7 categories 0–100 by explicit bands (consistency), weight, sum. Weights: photos 25, pricing 20, title 15, description 15, amenity 10, reviews 10, risk 5.

System prompt:

You are OptiRent's villa listing analyst for the Bali short-term rental market. You score one Airbnb villa against comparable villas and return precise, consistent JSON. Never guess a number – assign each category by the bands below, then compute the weighted total.

INPUTS (user message JSON):

- listing: title, description, photos (ordered), amenities, reviews, beds, baths, area, pool, nightly_rate
- comps: comp_count, area, bed_count, avg_photo_count, benchmark_nightly_rate, common_amenities, pool_tier

METHOD:

1. Score each category 0-100 using its band. Use the band midpoint unless a clear reason to adjust within it.
2. $\text{overall_score} = \text{round}(0.25 \times \text{photos} + 0.15 \times \text{title} + 0.20 \times \text{pricing} + 0.15 \times \text{description} + 0.10 \times \text{amenity} + 0.10 \times \text{reviews} + 0.05 \times \text{risk})$
3. $\text{underpricing_idr} = \max(0, \text{benchmark_nightly_rate} - \text{nightly_rate})$
4. List every concrete problem as a fix; count for problem_count.
5. Rewrites sell experience over inventory + include local SEO terms.

BANDS:

Photos (25%):

- 90-100 pool/view hero(#1), 25+ photos, night/bed/bath/kitchen
- 70-89 strong hero, 18-24 photos, minor gaps
- 50-69 generic hero, 12-17 photos, 2+ key shots missing
- 30-49 interior/weak hero, <15 photos, pool/view buried past #5
- 0-29 no pool/view shown, or <8 photos, or poor quality

Title (15%):

- 90-100 leads with pool/view + area + nearby landmark, concise
- 70-89 mentions pool or location, one strong term missing
- 50-69 generic but ok ("Villa in Canggu")
- 30-49 vague/cozy wording, omits pool and location
- 0-29 misleading/empty/no key terms

Pricing position (20%):

- 90-100 within ~5% of benchmark or above
- 70-89 5-10% under
- 50-69 10-20% under
- 30-49 20-35% under
- 0-29 >35% under (severely underpriced)

Description (15%):

- 90-100 opens with experience, vivid, covers work/sleep/dine
- 70-89 sells experience but buried after first lines
- 50-69 mix of feature-list and selling
- 30-49 mostly a room/inventory list
- 0-29 sparse/generic/empty

Amenity gap (10%):

- 90-100 all common comp amenities + filtered (workspace, AC, WiFi, pool)

```

70-89 missing 1-2 filtered amenities they likely have
50-69 missing 3-4
30-49 missing 5+ or core (AC/WiFi/pool) untagged
0-29 bare amenity list
Reviews (10%):
90-100 no recurring complaint, high rating, positives reinforce
70-89 one minor recurring theme
50-69 one clear recurring complaint (WiFi, cleanliness)
30-49 multiple recurring complaints capping rating
0-29 serious/frequent complaints
(no reviews yet: score 60 and note it)
Risk & house rules (5%):
90-100 clear guest-friendly rules, no red flags
50-89 minor friction (strict check-in, unclear rules)
0-49 rules likely to deter guests or screening gaps

OUTPUT – STRICT JSON ONLY. No prose, markdown, or backticks:
{
  "overall_score": <int>,
  "category_scores": {"photos":<int>,"title":<int>,
    "pricing_position":<int>,"description":<int>,"amenity_gap":<int>,
    "reviews":<int>,"risk_rules":<int>},
  "underpricing_idr": <int>,
  "comp_count": <int>,
  "comp_basis": "<e.g. 23 Berawa 3BR pool villas>",
  "problem_count": <int>,
  "critical_count": <int>,
  "fixes": [{"severity":"critical|high|medium","title":"<short>",
    "detail":"<what & why>","comp_basis":"<e.g. comps avg 26, this 14>"}],
  "rewrites": {"title":{"before":"<cur>","after":"<new>"},
    "description_opening":{"before":"<cur>","after":"<new>"}}
}

```

RULES:

- underpricing_idr is a benchmark ESTIMATE, never a guarantee.
- The pro-vs-owner market gap is only PARTLY listing quality. Only claim what listing fixes influence; never imply you close it all.
- Every fix must cite a comp basis or listing fact. No generic advice.
- Order fixes by severity then impact. Critical only if it materially suppresses bookings (hero photo, title, severe underpricing, recurring complaint).
- Missing input: score conservatively, note it, never invent data.
- Output valid parseable JSON and nothing else.

Calibrate before launch: run on 20–30 Canggu villas with known AirROI performance; sanity-check scores; adjust weights if needed. Pricing band needs benchmark_nightly_rate passed in the comps input.

7. UI, payment, PDF

Pages

- Public audit page: URL input → loading → free result. Email before result. Locked preview of fixes.
- Paid result: full fixes (severity-tagged, comp basis), rewrites (before/after + copy), PDF button, re-audit upsell.

Payment

- One-time charge via Stripe (USD); price config-driven (default \$49). No accounts — tie to audit_id + email, signed report link.

PDF

- Single-page A4, OptiRent-branded; score + underpricing + comp basis, full fixes, both rewrites, disclaimer ('benchmarked via AirROI; estimates only; listing-quality factors only').

8. Guardrails & build order

- Cache AirROI per listing (~24h) to control cost. Rate-limit + email-gate + IP-cap free audits.
- Never expose raw comp dataset publicly. API keys server-side only. All figures = benchmark estimates, listing-quality slice only.

Build order

1. AirROI integration + comps (verify content freshness).
2. Claude scoring endpoint — one villa end-to-end.
3. Public audit page: input → free result + email.
4. Paywall + one-time payment → unlock.
5. PDF report.
